

Abstract

A wall article hanger and method of hanging a wall article that uses a d-ring assembly comprises providing a prong-containing hanger device that attaches to the d-ring assembly and remains in a relatively vertical position after being
5 attached. With the hanger device in place, the prongs are angled towards the wall surface that the wall article is to be hung on. The wall article can then be pushed toward the wall, such that the prongs penetrate the wall and support the wall article.
